SIMSON DEBATE

Mar. B

HYUNDAI

THBT humanoid robots like Atlas must be restricted from fully replacing humans in automobile factories.

- ☐ **stability** n. 안정
- ☐ **unlimited** adj. 무제한의
- ☐ **automation** n. 자동화
- ☐ **benefit** v. 이익을 주다
- ☐ **decline** v. 감소하다
- ☐ **repetitive** adj. 반복적인
- ☐ **unemployment** n. 실업
- ☐ **productivity** n. 생산성
- ☐ **layoff** n. 정리해고
- ☐ **weaken** v. 약화시키다

DAY 1

Learning about the Topic

Brainstorming

Motion **THBT humanoid robots like Atlas must be restricted from fully replacing humans in automobile factories.**

key terms

humanoid: robot that looks like or is shaped like a human

be restricted: to be limited or controlled by rules or laws

automobile: a motor vehicle with four wheels that is used for transporting people on roads; a car

Think about the Motion!

1. Should humanoid robots be restricted to protect social stability?

Answers may vary

2. Could restricting robots weaken innovation and competitiveness?

Answers may vary

Vocabulary

Write the correct word for each definition and make a sentence using the word.

stability	unlimited	automation	benefit	decline
repetitive	unemployment	productivity	layoffs	weaken

1. (stability) : the state of being steady and not likely to change

e.g

2. (repetitive) : involving doing the same action again and again

e.g

3. (automation) : the use of machines or technology to do work automatically

e.g

4. (unlimited) : having no limits or restrictions

e.g

5. (benefit) : to get an advantage or positive effect

e.g

6. (decline) : to decrease or become less in amount or quality

e.g

7. (productivity) : the rate at which goods or services are produced

e.g

8. (unemployment) : the state of not having a job while wanting to work

e.g

9. (weaken) : to make less strong or less effective

e.g

10. (layoffs) : the act of workers losing their jobs because they are no longer needed

e.g

Motion **THBT humanoid robots like Atlas must be restricted from fully replacing humans in automobile factories.**

Purpose To see if full robot automation makes society and the economy better, or if limits are needed to keep things stable for the future.

Background

Humanoid robots like Atlas can now do complex work in car factories. They promise faster production and lower costs. But the real question is simple.

Should governments allow robots to replace workers completely? Or should they put limits on it? This debate looks at social **stability**, job change, and economic stability.

Perspective 1 : Social

Pro (Social Stability and Worker Protection)

From a social perspective, **unlimited automation** can cause serious problems.

First, many people can lose their jobs at once. Factory workers cannot quickly move to high-skill jobs. For example, after automation expanded in Amazon warehouses, many low-skill workers lost jobs, and only a few moved into technical roles.

Second, inequality can grow. Skilled technicians **benefit**, but replaced workers struggle.

Third, fast change can damage communities. When factories suddenly cut workers, local businesses **decline** and people become unhappy. So limits act as protection and give society time to adjust.

Con (Worker Safety and Social Progress)

Opponents say automation helps society.

First, robots take dangerous and **repetitive** tasks. In Tesla factories, workers moved

away from risky assembly work to checking and managing roles.

Second, technology usually changes jobs instead of removing them. After computers and the internet spread, companies like Microsoft created new jobs in IT, cybersecurity, and data science.

So blocking automation may slow long-term progress.

Perspective 2 : Economic

Pro (Consumer Collapse and Market Concentration)

Economically, unlimited automation also has risks.

First, production has little value without buyers. After automation increased in Foxconn factories, large layoffs happened and local business activity fell.

Second, **unemployment** increases government spending over time.

Third, automation helps large companies more than small ones. General Motors increased **productivity**, but mass **layoffs weakened** local middle-class communities.

So short-term efficiency does not always mean long-term growth.

Con (Productivity, Competitiveness, and Economic Transformation)

Opponents say automation strengthens the economy.

First, higher productivity lowers costs and increases demand.

Second, companies need automation to compete globally. Without it, they fall behind in price and quality.

Third, automation creates new industries. BMW increased productivity and used tax money for worker training. Also, flexible rules helped companies like Toss grow quickly and create new markets.

So controlled innovation can support long-term economic growth.

Conclusion

This debate is not about rejecting technology. It is about controlling its effects.

Supporters of limits worry about social instability, lower spending, and big-company dominance. Opponents focus on safety, productivity, and economic change.

In the end, the question is:

Should society choose maximum efficiency, or balanced progress with safety rules?

Reading Comprehension

1. How does the Pro side argue that restricting humanoid robots is socially necessary, and what reasoning supports this?

   The Pro side says unlimited automation causes social problems. Fast replacement leads to many job losses, and factory workers cannot easily move to high-skill jobs. This increases inequality and weakens communities. Therefore, limits give society time to adjust and keep stability.

2. How does the Con side argue that restricting humanoid robots may hinder social progress, and what key points are emphasized?

   The Con side says automation helps society. Robots take dangerous and repetitive tasks, and workers move to checking and managing roles. Technology usually changes jobs instead of removing them, as seen after computers and the internet. So restricting automation may slow long-term progress.

3. From an economic perspective, how does the Pro side argue that unrestricted automation may weaken the market, and what mechanisms are highlighted?

   The Pro side says production has little value without buyers. Large layoffs reduce spending and hurt local business activity. Automation also helps big companies more than small ones and weakens communities. So high efficiency does not always lead to stable growth.

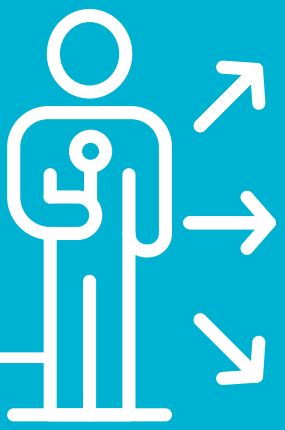

4. How does the Con side argue that automation strengthens economic competitiveness, and what outcomes are predicted?

   The Con side says automation lowers costs and increases demand. Companies need it to compete globally. It also creates new industries and supports worker training programs. So controlled innovation supports long-term economic growth.

5. What is the overall conclusion of the debate on restricting humanoid robots, and what central principle is emphasized?

   The debate is about controlling technology, not rejecting it. One side focuses on stability, and the other focuses on progress. The key idea is choosing between maximum efficiency and balanced change with safety rules.

DAY 2

Clash Points

Figure out the Clash Points VS ↔

In terms of Society

1 Proposition argues that:

Social Stability and Worker Protection

Unlimited automation causes mass job loss.

Most factory workers cannot quickly move to high-skill jobs.

This increases inequality and weakens local communities.

So limits are needed to allow gradual adjustment and protect social stability.

Rebuttals Technological Transformation and Social Progress

Technology has always changed jobs.

Automation changes work instead of simply removing it.

Robots take dangerous tasks and workers move to better roles.

Unemployment should be solved with training and policy, not by stopping technology.

In terms of Society

1 Opposition argues that:

Job Transformation and Shared Responsibility

Social responsibility does not mean stopping progress.

Automation is not the only cause of unemployment.

Lack of retraining and policy also causes job loss.

Blaming robots ignores the duty of governments and companies to help workers move to new jobs.

Technology has always changed jobs rather than permanently removing them.

Rebuttals Speed and Structural Shock

Humanoid automation replaces workers quickly and on a large scale.

Factory workers cannot instantly become robotics engineers or AI managers.

Unlike past gradual change, this shift can cause sudden unemployment.

Training takes time, but job loss happens immediately.

So those pushing rapid automation should take primary responsibility.

Figure out the Clash Points VS ↔

In terms of Economy

2 Proposition argues that:

Market Stability and Sustainable Growth

Unlimited automation may weaken the economic system.

Mass unemployment reduces spending and demand.

Productivity has little value if people cannot afford products.

Automation also increases welfare costs and long-term government burden.

It favors large companies with capital and pushes small firms out, reducing competition.

So limits are needed to protect market balance and long-term stability.

Rebuttals Innovation and Market Growth

Unemployment does not always destroy demand.

Lower costs reduce prices and expand access to goods.

Higher productivity increases profits and tax money, which can support training and welfare.

Market concentration is not only caused by automation but also weak competition policy.

Restricting automation may reduce competitiveness and slow growth.

Sustainable growth comes from innovation and adaptation, not limitation.

In terms of Economy

2 Opposition argues that:

Productivity and Competitiveness

Automation increases productivity and lowers costs.

Lower costs reduce prices and increase demand.

Global competition requires advanced automation.

Without it, companies fall behind in quality and efficiency.

Automation also creates new industries such as robotics, AI, and system management.

Economic growth should come from innovation, not restriction.

Rebuttals Consumer Base and Market Stability

Productivity has little meaning without consumers.

Large unemployment reduces spending and demand.

Automation favors large companies and reduces competition.

Short-term efficiency can cause long-term instability.

Sustainable growth requires balancing innovation and stability.

DAY 3

☞ **Step 1: Finish Your Template**

❶ Prepare your arguments for both sides at home.

❷ Listen to your friend's ideas and add the teacher's tips to complete your template.

☞ **Step 2: Practice with a Partner**

❶ Pair up with a classmate.

❷ Take turns being Proposition and Opposition and role-play the debate, using your templates.

Mock Debate Drill

Prime Minister

Hello everyone, I am the Prime Minister. First, let me introduce to you the motion of the debate.

As the Prime Minister, I strongly support the motion that humanoid robots like Atlas must be restricted from fully replacing humans in automobile factories. This is necessary for social stability and long-term economic growth.

First, from a social perspective, unlimited automation can cause mass job loss. Car factories employ many workers, and rapid replacement can create social problems.

Second, it weakens respect for human work. Workers should not be treated as replaceable costs. If a society values machines more than people, social stability can be damaged.

Third, inequality can grow. Only skilled technicians benefit, while replaced workers struggle, increasing the social gap.

Now, from an economic perspective, short-term efficiency does not always mean long-term growth.

Mass unemployment reduces spending and lowers demand, which harms businesses.

Furthermore, government spending increases. More welfare support and social dissatisfaction may appear.

Finally, automation favors large companies that can afford it. Small businesses are pushed out and competition decreases. This harms innovation and weakens the market.

Therefore, we believe limits on humanoid robots are necessary to protect stability and support sustainable economic growth.

Thank you.

automation replaceable weakens increases necessary
unemployment struggle stability competition problems

Leader of Opposition

Hello everyone, I am the Leader of Opposition, and I stand firmly against the motion.

The government says automation must be limited, but we believe limits will harm both society and the economy.

From a social perspective.

First, robots protect people from ___dangerous___ work. Car factories have many safety ___risks___, and robots improve worker safety.

Second, the quality of work ___improves___. When robots do ___repetitive___ tasks, humans move to roles such as design, management, and quality checking. Work becomes more skilled and meaningful.

Third, limiting technology means slowing social progress. History shows societies that accept ___innovation___ create more opportunities and grow more.

Now, from an economic perspective.

First, higher ___productivity___ lowers prices. Robots can work all day, reduce costs, and make cars more ___affordable___. This increases demand.

Second, global ___competition___ requires automation. Major car companies already use it. Without it, businesses fall behind in quality, speed, and price.

Third, new industries and jobs appear. Automation ___creates___ opportunities in robotics, maintenance, and software.

Therefore, the opposition believes active use, not ___restriction___, of humanoid robots benefits both society and the economy.

Thank you.

restriction creates affordable productivity risks
innovation repetitive improves competition dangerous

Deputy Prime Minister

Hello everyone, I am the Deputy Prime Minister.

I will first rebut the Opposition LO's arguments and then reinforce the Government's position.

First, on the social side. The opposition says robots improve safety. However, safety can be improved with better equipment and stricter rules. We do not need to accept mass job loss for safety. They also say the quality of work will improve. This is unrealistic.

Most factory workers cannot quickly move to high-skill jobs, and many will be pushed out of the job market. For example, after automation expanded in Amazon warehouses, many low-skill workers lost their jobs, but only a small number moved into technical roles.

Now, on the economic side. The opposition focuses on productivity. But productivity has little value without consumers. Rising unemployment reduces spending and weakens company growth. After automation increased in Foxconn factories, large layoffs happened and local economies declined. They also say automation improves global competitiveness. However, industries built on social instability cannot last long. In the United States, General Motors increased productivity through automation, but mass layoffs harmed local economies and the middle class. The problem is not technology itself but the speed of use. Uncontrolled automation leads to social disruption, not progress.

Therefore, restrictions are not regression. They are necessary for sustainable development.

regression disruption competitiveness layoffs productivity
high-skill technical improve improved loss

Deputy Leader of Opposition

Hello everyone, I am the Deputy Leader of Opposition.

I will rebut the PM's arguments and reinforce the Opposition's position.

First, on the social issue. The government focuses on unemployment. However, every technological change has changed jobs and ___created___ new ones. After computers and the internet spread, companies like Microsoft created jobs in IT, data, and security. Stopping change means ___losing___ future competitiveness. The government also talks about dignity. But dangerous and ___repetitive___ factory work does not protect dignity. For example, Tesla's automation ___reduced___ risky assembly tasks and moved workers to roles such as management and ___quality___ checking. Automation can create safer and more meaningful work.

Now, on the economic issue. The government worries about higher welfare costs. However, automation ___increases___ productivity and profits. This raises tax money and supports job training and welfare programs. German companies like BMW show automation can ___strengthen___ both industry and social systems. The government also warns about monopoly. But too many rules can protect old large companies and ___block___ innovation. Toss grew quickly after rule changes ___allowed___ new competition in fintech. Restriction is not safety. It is stagnation. To stay competitive, we need ___innovation___ with proper management, not artificial limits.

Thank you.

innovation	block	allowed	strengthen	increases
losing	quality	reduced	repetitive	created

Government Whip

Hello everyone, I am the Government Whip

The core question of today's debate is simple. Does unlimited automation make society and the economy stronger, or weaker?

The government has shown the answer. From a social perspective, unlimited automation causes mass job loss, increases inequality, and creates social instability. Many workers are pushed out of the labor market without preparation. This is not only a personal problem but a threat to social stability.

From an economic perspective, the results are also serious.

Rising unemployment reduces spending, and higher welfare costs create long-term pressure on national finances.

Also, only a few companies that can afford automation survive, which reduces competition.

Technology without trust and stability cannot last.

We do not reject technology. We reject irresponsible use. Limits are not barriers to development. They are safeguards that allow society and the market to grow together. They are the minimum condition for a future where humans and technology coexist.

Therefore, in this debate, the most responsible choice for society and the economy is the government side.

Thank you.

irresponsible minimum safeguards afford reduces
shown stability preparation mass inequality

Opposition Whip

Hello everyone, I am the Opposition Whip

Today, the government focused on the risks of automation and supported limits based on fear.

However, the opposition has shown that ____fear____ is not a solution and cannot create progress.

From a social perspective, robots ____protect____ workers from hard and dangerous ____environments____ and create safer workplaces. Stopping technological change also stops social ____progress____.

From an economic perspective, automation increases ____productivity____, lowers production costs, and improves quality and speed. This strengthens company ____competitiveness____. As a result, markets grow, investment increases, and new industries and jobs ____appear____. This creates continuous growth, not ____decline____.

____Limits____ do not solve the problem. They only move responsibility for unemployment onto technology. Rules may hide an unprepared society, but they are not the real answer.

In the end, this debate is about choice. Do we choose the future or stagnation? The opposition chooses ____possibility____ over fear.

Therefore, in this debate, the opposition is correct.

Thank you.

possibility limits competitiveness productivity decline
appear progress environments protect fear

Debate Instructions to Judges

DIRECTIONS:

In the Simson debate, the winning team is the one with the most points—there are no low-point wins. Use the guidelines below to determine your scores.

STANDARDS FOR SCORING:
Every speech is scored out of a possible 83 points.

Note: For purposes of consistency, scores should be between 67 and 83 for the three speeches per team. Judges should not go outside this range.

You may give or take away 1 or 2 points, per debater, for strong/weak offering and receiving of Points of Information.

81-83	• Brilliant arguments successfully engage with the main issues in the round. • Arguments are very well-explained, always central to the case being advocated, and demand extremely sophisticated responses. • The speech is very clear and incredibly compelling. Structure and role fulfillment are executed flawlessly.
79-80	• Very good, central arguments engage well with the most important issues on the table and are highly compelling; sophisticated responses would be required to refute them. • Delivery is clear and very persuasive. Role fulfillment and structure are probably flawless.
77-78	• Relevant and pertinent arguments address key issues in the round with sufficient explanation. • The speech is clear in almost its entirety, and holds one's attention persuasively. • Role is well-fulfilled and structure is unlikely to be problematic.
74-76	• Arguments are almost exclusively relevant, and frequently persuasive. Occasionally, but not often, the speaker may slip into: i) deficits in explanation, ii) simplistic argumentation vulnerable to competent responses, or iii) peripheral or irrelevant arguments. • The speaker holds one's attention, provides clear structure, and successfully fulfills their basic role on the table.
72-73	• Arguments are generally relevant, and some explanation of them given, but there may be obvious gaps in logic, multiple points of peripheral or irrelevant material and simplistic argumentation. • The speaker mostly holds the audience's attention and is usually clear, but rarely compelling, and may sometimes be difficult to follow. • There is a decent but incomplete attempt to fulfill one's role on the table, and structure may be imperfectly delivered.
70-71	• Relevant arguments are frequently made, but with very rudimentary explanation. • The speaker is clear enough to be understood the vast majority of the time, but this may be difficult and/or unrewarding. • Structure poor; poor attempt to fulfill role.
69	• The speaker is often relevant, but rarely makes full arguments. • Frequently unclear and confusing; really problematic structure/lack thereof; some awareness of role.
68	• The speech rarely makes relevant claims, only occasionally formulated as arguments. • Hard to follow, little/no structure; no evident awareness of role.
67	• No structure or fulfillment of role in any meaningful sense is provided, OR did not speak at all.

What is a POI?

A POI means **Point Of Information**
It is something you raise during the speech of your opponent when something in their speech doesn't add up or when you want a clarification to something they have said.

A POI is a very important part of a debate since you get to either rebut or question your opponents arguments or definitions in real time!

You may raise a POI by respectfully saying "point" and raising your right hand during your appointments speech.

You may raise a point after your opponents first definition or argument.
If your opponent has not introduced any definitions or arguments you may not raise a point, since there is nothing to clarify in that case.

But, note that all speakers have the freedom to accept or reject any offered POI's.

So if your POI has been denied please respect the speaker for doing so.

Let's Make a POI!

Academic Essay

Essay Writing Guide

☞ **We will write an essay using what we learned in Day 1(motion), Day 2(clash points), and Day 3(debate templates).**

☞ **Write your essay online in 4 paragraphs:**

Intro - Body 1 - Body 2 - Conclusion

Instruction	Write like this!
[Intro] In the Intro, **we use the motion**. Do you agree or disagree with the motion we learned?	I (agree / disagree) with the motion, “ _____ .” *(motion)*
[Body] **In the Body, we write the reasons for our side (agree or disagree).** **Use examples or explanations from the** **① text (Day1),** **② clash points (Day2),** **③ Templates (Day3).** **④ or your own ideas.**	**Body 1** The most important reason is that _____ . I think this is important because _____ . For example, _____ . **Body 2** The next important reason is that _____ . I also believe this matters because _____ . For example, _____ .
[Conclusion] The Conclusion is the ending. ① Summarize your Body ② Restate your opinion about the motion	① In conclusion, I (agree / disagree) with the motion because _____ and _____ . ② Therefore, _____ .

↳ Example

Intro

I agree with the motion, humanoid robots must be restricted from fully replacing humans in automobile factories.

Body 1

The most important reason is that unlimited automation harms social stability.

I think this is important because many workers can lose their jobs quickly and cannot move to high-skill jobs.

For example, after automation expanded in Amazon warehouses, many low-skill workers lost their jobs while only a few moved to technical positions.

Body 2

The next important reason is that it weakens the economy in the long term.

I believe this matters because unemployment reduces spending and demand.

For example, after automation increased in Foxconn factories, large layoffs happened and local economies declined.

Conclusion

In conclusion, I agree with the motion because in terms of society, limits protect stability and in terms of the economy, they support sustainable growth.

Therefore, humanoid robots should not fully replace human workers in automobile factories.
